What is HTML?

HTML stands for Hypertext Markup Language and is used for creating web applications or websites. It serves as the foundational language that structures web pages.

History of HTML

- HTML was invented by Tim Berners-Lee in 1991.
- The first version of was HTML 1.0.
- HTML 5 is the latest version, it was released in 2014.
- It introduced significant updates and improvements.

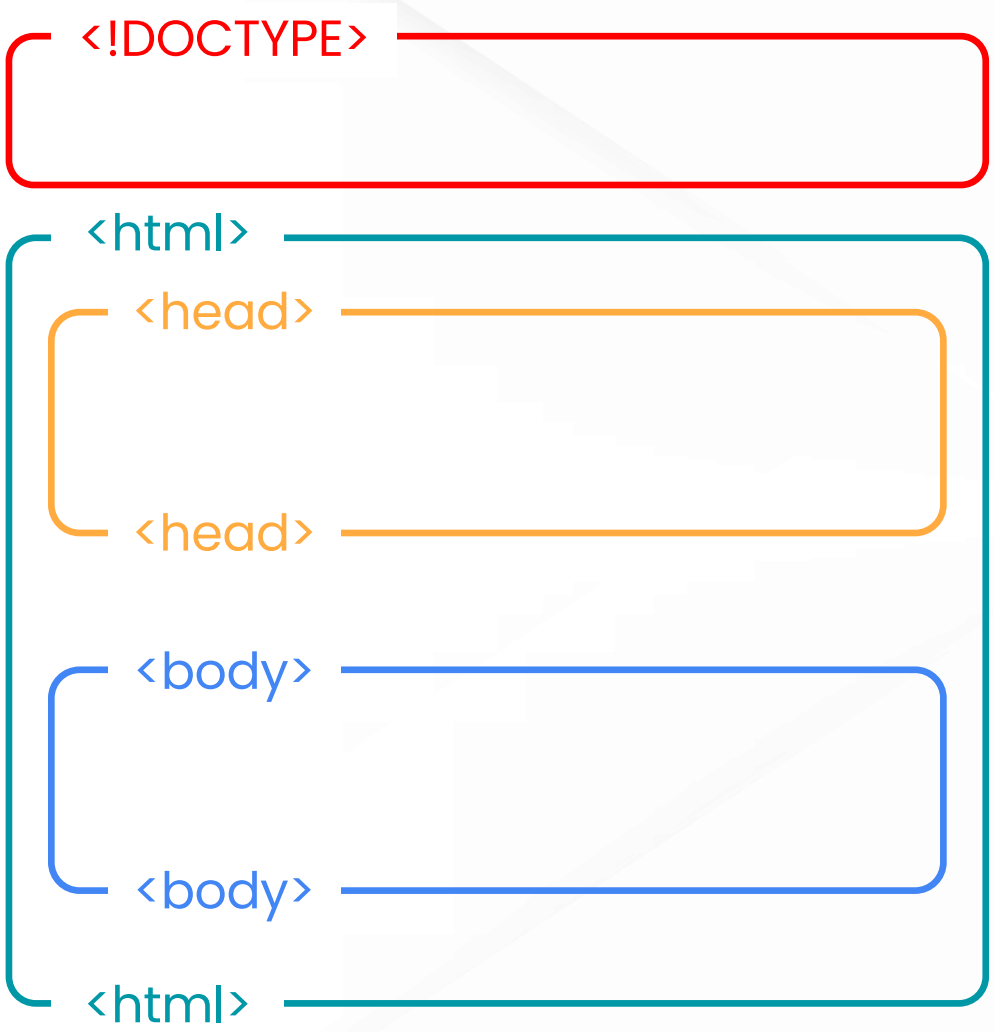
Structure of HTML Document



Alt text: *HTML Structure*

An HTML document, often called a web page, uses elements and tags to define its structure. Elements enclosed by tags instruct web browsers on content display, the webpage's structure and layout.

The structure of the HTML document looks like the image given here.

Reliance Foundation

N·S·D·C RE>IMAGINE FUTURE

<!DOCTYPE>

It is the First Element of HTML that defines the type of document as an HTML document.

<html>

It is the outermost or the root element that contains all other HTML elements within a web page.

<head>

<head>

The contents of the <head> element are not visible on the screen. It contains metadata about the page, such as information about external files attached to the document.

<body>

<body>

Container of all tags what you want to see on your web page.

<html>

In this document structure, the words HTML, HEAD, BODY are called tags.

Elements and Tags

Tags: HTML tags are the building blocks of a webpage and each tag serves a specific purpose. Tags are keywords surrounded by angle brackets (**‹** and **›**). Tags usually come in pairs:

1. **Opening tag-** indicates the beginning of an element, represented by <, >.

   For example, 'h1' is used to create the most important heading, written as <h1>.

2. **Closing tag-** Denotes the end of the element, represented by </, >.

   For example, closing tag of 'h1' will be written as </h1>.

HTML Elements

Alt text: *HTML element image*

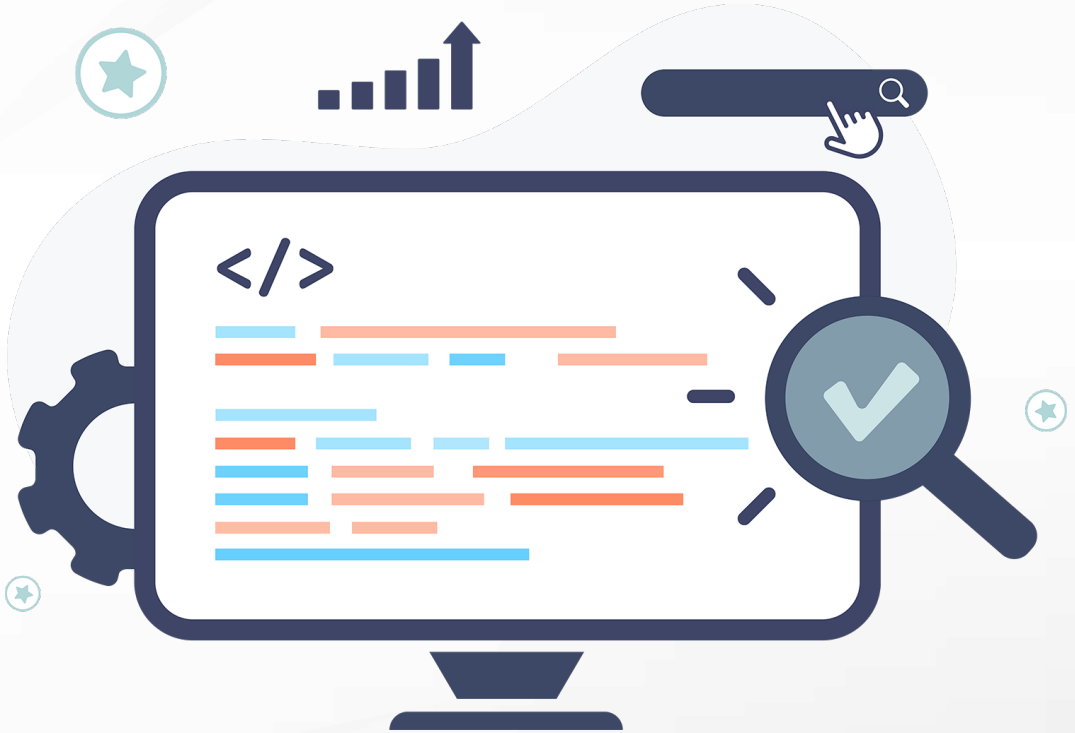
An element is made up of a pair of tags along with the content they enclose. Elements can be nested within each other.

For example: <h1> is the tag and an element always contains the opening tag, the closing tag and the text on which you want to apply that tag.

Types of Tags

a. Empty tags: Empty tags, also known as self-closing tags, are HTML elements that do not require closing tags.

Example: <br>, <img>, <hr>

b. Non Empty tags: These tags require both opening and closing tags and may enclose content between them.


Example: <p>, <h1>, <a>
